

Investigating diet, health and location across teenagers in Europe

To investigate and share our experiences of how where we live affects what we eat and grow and how that affects our health, culture and lifestyles. As well as a diet analysis, we will be looking at it from a scientific basis with potential analysis of things such as soil quality, vitamin content of vegetables, farming/growing methods in our local areas etc. We can share experiences of local dishes as well as information on our diet profiles.
